

Banks are presenting various solutions and privileges to their customers, thanks to growing banking industry. They are finding solutions for the fiscal demands of customers by their employees.

Data of the customers shall be recorded in the system. Banking employees may monitor the said data by using the personal user name and password. The employees may open an account and create a customer number for a person who is a new customer to the bank by taking the personal information (name, surname, address, phone number and e-mail) of the customer, or may update the information of an existing customer, or may close an account if there is no balance in the account according to the demand of customer.

Customers use their accounts usually for putting money to their accounts, drawing money or transferring money to another persons account. These demands of customers may be solved easily. At the same time, bank employees may monitor the transactions of customers in order to be informed about the income situation of bank. Money transfers between the accounts may be monitored independently due to the importance of their nature. The said transfers include the rank number, account number of sender and receiver and date.

The balance amounts of customers change over time according to the transactions, customers made. These changes occur according to the nature of transactions (like decreasing the amount from senders account and transferring the amount to the receivers account). Transactions effects the accounts simultaneously.
